## Welcome to Apache Maven

Apache Maven is a software project management and comprehension tool, and documentation from a central piece of information.

If you think that Maven could help your project, you can find out more information [what Maven is](#), a [list of some of its main features](#), and a set of [frequently asked questions](#).

# CLEAR CONCEPTS

*WHAT? - the project-specifics are **described** HOW? - implemented in reusable **plugins** WHERE? - everything is in the **repository***

# WHY MAVEN?

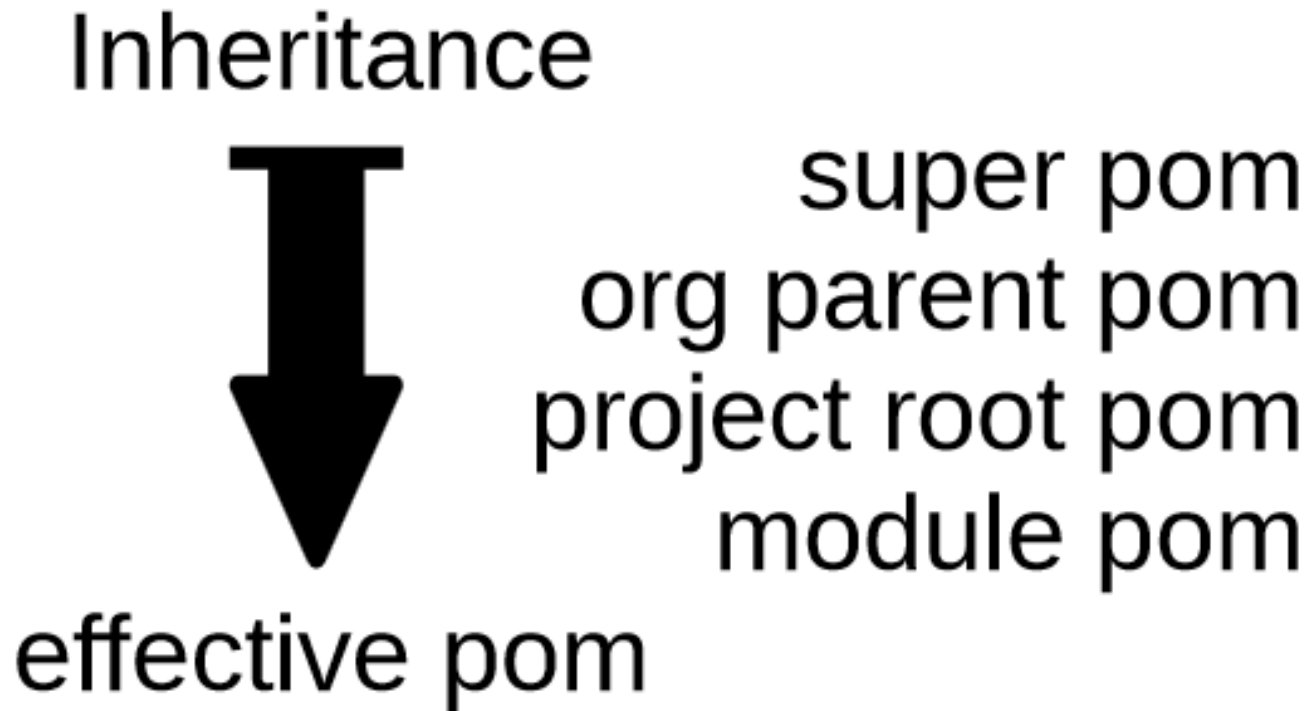

# AGENDA

- What is it?
- **Concepts**
- Configuration
- Lifecycles and phases
- Profiles
- Dependencies
- Multi-Module projects
- How to ...

# PROGRAM OBJECT MODEL

# Universal reuse through **plugins**

# REPOSITORIES

Public  
Org internal  
Local

binaries and  
metadata

# DEPENDENCIES

Reuse

Made

Easy

# Structure

multi-module projects  
aggregation

# IDE INDEPENDENCE

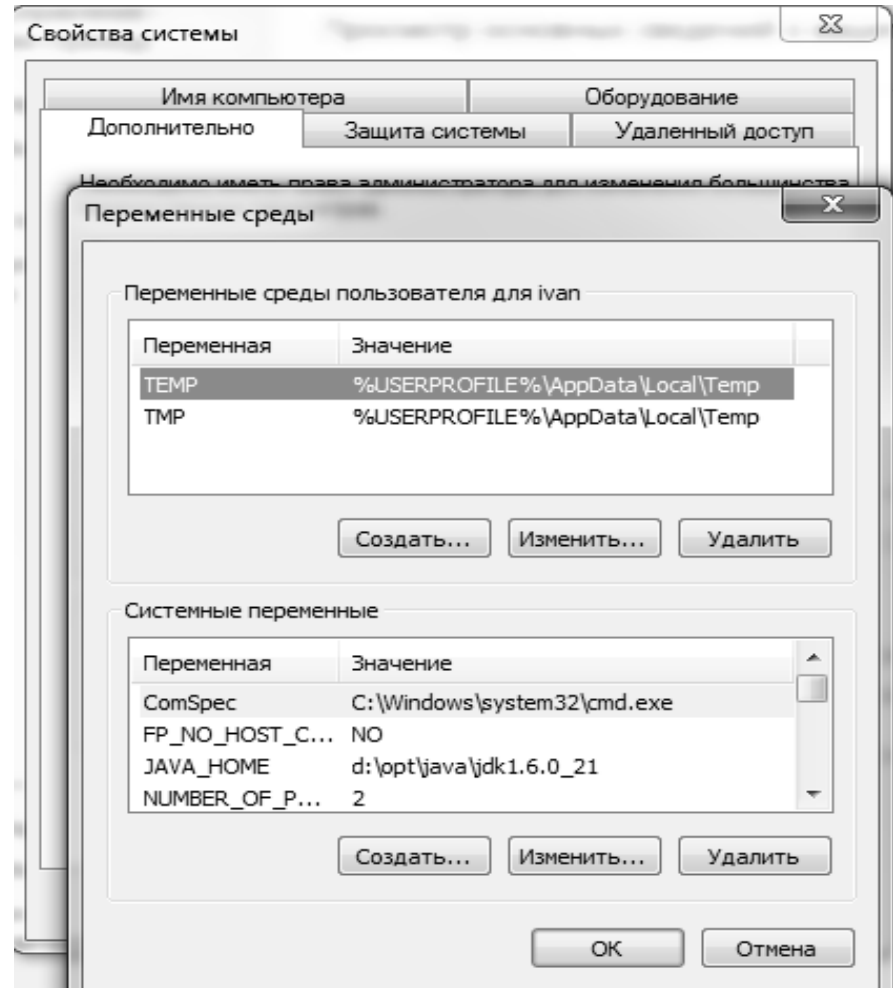

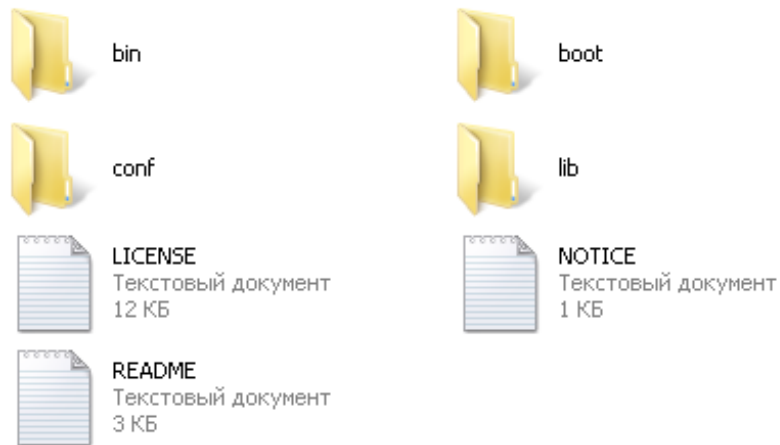

# AGENDA

- What is it?
- Concepts
- **Configuration**
- Lifecycles and phases
- Profiles

```

# PACKAGE

# INSTALL

# LYFECYCLE

Typical Project Object Model (POM) Build Life Cycle

validate	compile	test	package	integration test	verify	install	deploy
validate all necessary information for the project	compile the source code	test the compiled source code	package up compiled source and other resources	deploy package for integration testing	verify package against criteria	install the package into the local repository	deploy the package to a remote repository

Figure 1

# ЖИЗНЕННЫЙ ЦИКЛ ОЧИСТКИ

# „Default” lifecycle

For packaging: ejb, ejb3, jar, ...

Lifecycle phase	plugin:goal
process-resources	resources:resources
compile	compiler:compile
process-test-resources	resources:testResources
test-compile	compiler:testCompile
test	surefire:test
package	ejb:ejb or jar:jar or ejb3:ejb3...
install	install:install
deploy	deploy:deploy

## „Clean” lifecycle:

phase	plugin:goal
pre-clean	
clean	clean:clean
post-clean	

## „Site” lifecycle:

phase	plugin:goal
pre-site	
site	site:site
post-site	
site-deploy	site:deploy

# PRACTICE

Настройте профиль development. Настройте следующий плагин:

`<plugin>`

`<groupId>org.apache.maven.plugins</groupId>`

`<artifactId>maven-jar-plugin</artifactId>`

`<configuration>`

`<archive>`

`<manifest>`

`<addClasspath>>true</addClasspath>`

`<classpathPrefix>lib/</classpathPrefix>`

`<mainClass>by.academy.it.App</mainClass>`

`</manifest>`

`</archive>`

`</configuration>`

`</plugin>` и покажите его работу.

# PRACTICE

Настройте зависимость многомодульного проекта на Oracle database driver. Выполните сборку проекта и проверьте, что она прошла успешно.

[http://www.oracle.com/technology/software/tech/java/sqlj\\_jdbc/index.html](http://www.oracle.com/technology/software/tech/java/sqlj_jdbc/index.html)

```
mvn install:install-file -Dfile=ojdbc5.jar -DgroupId=com.oracle -  
DartifactId=ojdbc5 -Dversion=11.2.0.3.0 -Dpackaging=jar -  
DgeneratePom=true
```

```
<dependency>  
  <groupId>com.oracle</groupId>  
  <artifactId>ojdbc5</artifactId>  
  <version>11.2.0.3.0</version>  
</dependency>
```

# MULTI-MODULE PROJECTS

  </repository>
</repositories>
```

# MAVEN COORDINATES

- A valid Maven POM file must have groupId, artifactId, and version. The groupId and the version elements can also be inherited from the parent POM file.

```
<plugin>  
  <artifactId>maven-antrun-plugin</artifactId>  
  <version>1.3</version>  
</plugin>
```

# MAVEN COORDINATES

## settings.xml

```
<!-- pluginGroups
| This is a list of additional group identifiers that
| will be searched when resolving plugins by their prefix, i.e.
| when invoking a command line like "mvn prefix:goal".
| Maven will automatically add the group identifiers
| "org.apache.maven.plugins" and "org.codehaus.mojo"
| if these are not already contained in the list.
|-->
<pluginGroups>
  <!-- pluginGroup
  | Specifies a further group identifier to use for plugin
  | lookup.
  <pluginGroup>com.your.plugins</pluginGroup>
  -->
</pluginGroups>
```

# DEPENDENCY MANAGEMENT

- Mechanism to centralize dependency information
- Have all information about dependencies in the parent POM (version, exclusions, scope, type)
- Child POMs only have to have a simple reference to the dependencies, excluding version, exclusions, scope type.

# CHILD POM

```
<dependencies>
  <dependency>
    <groupId>org.apache.axis2.wso2</groupId>
    <artifactId>axis2</artifactId>
  </dependency>
  <dependency>
    <groupId>org.apache.ws.commons.axiom.wso2</groupId>
    <artifactId>axiom</artifactId>
  </dependency>
</dependencies>
```

Here, you will see only groupId and artifactId of a given dependency but not version.

# UMBRELLA PROJECTS (DEPENDENCY GROUPING)

```
<dependency>
  <groupId>org.apache.axis2</groupId>
  <artifactId>axis2-kernel</artifactId>
  <version>1.6.2</version>
</dependency>
<dependency>
  <groupId>org.apache.axis2</groupId>
  <artifactId>axis2-adb</artifactId>
  <version>1.6.2</version>
</dependency>
<dependency>
  <groupId>org.apache.axis2</groupId>
  <artifactId>axis2-transport-http</artifactId>
  <version>1.6.2</version>
</dependency>
<dependency>
  <groupId>org.apache.axis2</groupId>
  <artifactId>axis2-transport-local</artifactId>
  <version>1.6.2</version>
</dependency>
<dependency>
  <groupId>org.apache.axis2</groupId>
  <artifactId>axis2-xmlbeans</artifactId>
  <version>1.6.2</version>
</dependency>
```

If you have multiple Axis2 client modules, in each module, you need to duplicate all these dependencies:

# UMBRELLA PROJECTS (DEPENDENCY GROUPING)

```
<project>
  <modelVersion>4.0.0</modelVersion>
  <groupId>com.epam</groupId>
  <artifactId>axis2-client</artifactId>
  <version>1.0.0</version>
  <packaging>pom</packaging>
  <dependencies>
    <dependency>
      <groupId>org.apache.axis2</groupId>
      <artifactId>axis2-kernel</artifactId>
      <version>1.6.2</version>
    </dependency>
    <dependency>
      <groupId>org.apache.axis2</groupId>
      <artifactId>axis2-adb</artifactId>
      <version>1.6.2</version>
    </dependency>
    <dependency>
      <groupId>org.apache.axis2</groupId>
      <artifactId>axis2-transport-http</artifactId>
      <version>1.6.2</version>
    </dependency>
    <dependency>
      <groupId>org.apache.axis2</groupId>
      <artifactId>axis2-transport-local</artifactId>
      <version>1.6.2</version>
    </dependency>
    <dependency>
      <groupId>org.apache.axis2</groupId>
      <artifactId>axis2-xmlbeans</artifactId>
      <version>1.6.2</version>
    </dependency>
  </dependencies>
</project>
```

```
<project>
  <modelVersion>4.0.0</modelVersion>
  <groupId>com.epam.maven</groupId>
  <artifactId>my-axis2-client</artifactId>
  <version>1.0.0</version>
  <dependencies>
    <dependency>
      <groupId>com.epam.maven</groupId>
      <artifactId>axis2-client</artifactId>
      <version>1.0.0</version>
    </dependency>
  </dependencies>
</project>
```

# TRANSITIVE DEPENDENCIES

# OPTIONAL DEPENDENCY

- The idea is that some of the dependencies are only used for certain features in the project, and will not be needed if that feature isn't used. Ideally
- **Project-A -> Project-B**

```
<project>
  ...
  <dependencies>
    <!-- declare the dependency to be set as optional -->
    <dependency>
      <groupId>sample.Projects</groupId>
      <artifactId>Project-B</artifactId>
      <version>1.0</version>
      <scope>compile</scope>
      <optional>true</optional>
      <!-- value will be true or false only -->
    </dependency>
  </dependencies>
</project>
```

- **Project-X -> Project-A**
  - You'll notice that Project-B is not included in the classpath of Project-X; you will need to declare it directly in your POM in order for B to be included in X's classpath

# TRANSITIVE DEPENDENCIES

- Everything will work fine till one fine day, you update the version of lib, and the new version
- could have a reference to a new version of jar, which is not compatible with your code. This could easily break your build or might cause test cases to fail.

# TRANSITIVE DEPENDENCIES

```
$ mvn dependency:analyze
```

```
[INFO] --- maven-dependency-plugin:2.8:analyze (default-cli) @  
jose ---
```

```
[WARNING] Used undeclared dependencies found:
```

```
[WARNING] net.minidev:json-smart:jar:1.1.1:compile
```

# AVAILABLE SCOPES

- 6 Available Scopes
  - Compile
  - Provided
  - Runtime
  - Test
  - System
  - Import (Maven 2.0.9 onwards)

# EXCLUDED DEPENDENCIES

```
<dependencies>
  <dependency>
    <groupId>GroupX</groupId>
    <artifactId>ArtifactX</artifactId>
    <exclusions>
      <exclusion>
        <groupId>GroupZ</groupId>
        <artifactId>ArtifactZ</artifactId>
      </exclusion>
    </exclusions>
  </dependency>
</dependencies>
```

# PARALLEL BUILDS IN MAVEN 3

Maven 3.x has the capability to perform parallel builds. The command is as follows:

- `mvn -T 4 clean install` # Builds with 4 threads  
`mvn -T 1C clean install` # 1 thread per cpu core  
`mvn -T 1.5C clean install` # 1.5 thread per cpu core
- This build-mode analyzes your project's dependency graph and schedules modules that can be built in parallel according to the dependency graph of your project.

# PARALLEL BUILDS IN MAVEN 3

- On level 2 you'll be running 3 parallel modules, and 7 on 3, 5 on level 4.
- The parallel build feature rewards "correct" modularizations. If your project has degenerated inter-module dependencies (excessive dependencies inside reactor), you will probably see gains by cleaning up the dependencies.

# MAVEN RELEASES HISTORY
